

Confidential Research Brief: Project Chronos-Q

Principal Investigator: Dr. Elena Rostova

Affiliation: Quantum Horizons Laboratory

Project Focus: Scalable Topological Quantum Error Correction architectures.

Background: Project Chronos-Q explores photonic interconnects for fault-tolerant quantum computing clusters. Dr. Elena Rostova has spearheaded research on Majorana fermion braiding algorithms to reduce decoherence rates below 0.001%.

Objective: Synthesize modern breakthroughs in quantum computing, evaluate real-world benchmarks from web literature, and ensure compatibility with photonic quantum architectures.
